***Massive change in the nature of work will require many to learn new skills.***

---

**Brookfield, WI** – We live in an age of technology, with automation and artificial intelligence no longer being things of science fiction, but the reality of today's life. Robotic surgery has forever changed healthcare, and assembly lines in factories no longer require workers. The massive change requires us to look at what work will be in the years and decades ahead. Democrat Tom Palzewicz, running for the Fifth Congressional District seat, believes America needs to plan now for the future and make the necessary adjustments.

Since the beginning of the Industrial Revolution in the mid-19th Century, America has been transformed from a largely agrarian society into an industrial power and then into a technological leader as the world economy has become global. Where do people fit into the new equation? What will work look like? Will there be any need for people? More importantly, for Palzewicz, will the ever-expanding divide between rich and poor and the elimination of the middle class spell the end of the American dream?
