Sand Mine Spill Exposes the Consequences of Poor Regulation

Posted on May 30, Posted by <u>Kathleen Vinehout, State Senator 31st District</u> Category <u>Wisco</u> <u>nsin</u>

The recent Hi-Crush Mine spill highlights how the poorly regulated sand mining industry has consequences on local communities. Wisconsin can do better to protect the public and the environment.

WHITEHALL, WI - "A really unfortunate series of circumstances," was how Kevin Lien described a recent spill of ten million gallons of orange sludge from a sand mine processing facility.

A bulldozer and its operator slid into a deep settling basin at the Hi-Crush mine and sand processing plant in Whitehall, Wisconsin. Mine workers, working with emergency responders, dug through an earthen berm and intentionally released the thick, orange sludge.
